

# NGINX (4 days )

By Dr. Vishwanath Rao

## Course Contents:

### 1. Introduction and Installation of NGINX WebServer

Introduction

Installing NGINX using a package manager CentOS

Debian

Installing NGINX from source

Preparing a build environment

Compiling from source

Configuring for web or mail service Configure options for a mail proxy Configure the options to specify paths Enabling various modules

Disabling unused modules

Finding and installing third-party modules Putting it all together

### 2. A Configuration Guide

The basic configuration format

NGINX global configuration parameters Global configuration directives

Using include files

The HTTP server section

Client directives

HTTP client directives

File I/O directives

HTTP file I/O directives

Hash directives

HTTP hash directives

Socket directives

HTTP socket directives

Sample configuration

The virtual server section

listen parameters

Locations – where, when, and how Location modifiers

Location-only directives

The mail server section

Mail module directives  
Mail SSL directives  
Full sample configuration

### 3. Using the Mail Module

Basic proxy service  
POP3 service  
IMAP service  
SMTP service  
Using SSL/TLS  
Complete mail example Authentication service Combining with memcached  
Interpreting log files Operating system limits

### 4. NGINX as a Reverse Proxy

Introduction to reverse proxying The proxy module  
Legacy servers with cookies  
The upstream module  
Keepalive connections  
Load-balancing algorithms  
Types of upstream servers  
Single upstream server  
Multiple upstream servers  
Non-HTTP upstream servers

Memcached upstream servers  
FastCGI upstream servers  
SCGI upstream servers  
uWSGI upstream servers  
Converting an "if"-fy configuration to a more modern interpretation Using error documents to handle upstream problems  
Determining the client's real IP address 5. Reverse Proxy Advanced Topics  
Security through separation  
Encrypting traffic with SSL  
Authenticating clients using SSL  
Blocking traffic based on originating IP address Isolating application components for scalability Reverse proxy performance tuning  
Buffering  
Caching Storing Compressing

## 6. The NGINX HTTP Server

NGINX's architecture The HTTP core module The server

Logging

Finding files

Name resolution

Name resolution directives

Client interaction

HTTP client interaction directives Using limits to prevent abuse HTTP limits directives

Restricting access

HTTP access module directives Streaming media files

HTTP streaming directives Predefined variables

Using NGINX with PHP-FPM FastCGI directives

An example Drupal configuration Wiring NGINX and uWSGI together An example Django configuration

## 7. NGINX for the Developer

Caching integration

No application caching

Caching in the database Memcached module directives Caching in the filesystem

Header modifying directives Changing content on-the-fly The addition module

HTTP addition module directives The sub module

The xslt module

HTTP XSLT module directives Using Server Side Includes

Server Side Includes directives Server Side Includes commands Decision-making in NGINX

Perl module directives

Creating a secure link

Generating images

Image filter directives

Tracking website visitors

UserID module directives

Preventing inadvertent code execution

## 8. Troubleshooting Techniques

Analyzing log files

Error log file formats

Error log file entry examples

Configuring advanced logging

- Debug logging
- Switching binaries at runtime
- Using access logs for debugging
- Common configuration errors
- Using if instead of try\_files
- Using if as a hostname switch
- Not using the server context to best effect
- Operating system limits
- File descriptor limits
- Network limits
- Performance problems
- Using the Stub Status module
